ReSharper 1.5

The Most Intelligent Add-In To VisualStudio.NET

ReSharper comes equipped with a rich set of features, such as intelligent coding assistance, on-the-fly error highlighting and quick error correction, unmatched refactoring support, and a whole lot more. ReSharper's tight integration with Visual Studio .NET provides quick and easy access to all of its advanced features right from the IDE.

KEY FEATURES

Syntax and Error Highlighting

```
undefinedSymbol  
string s = 123;|  
Cannot convert source type 'int' to target type 'string'
```

One of the most powerful and helpful features in ReSharper is its ability to quickly detect and highlight errors in code, without the need to compile it. ReSharper automatically analyzes your code while you work and will highlight a variety of possible syntax or logical errors.

Error Quick-Fixes and Code Assistance

```
object o = "123";  
string s = o;  
Cast to 'string'  
Safely cast to 'string'  
Change type of 's' to 'object'
```

```
object o = "123";  
string s = o as string;
```

Not only does ReSharper highlight errors, but it also provides useful quick-fixes that enable you to instantly correct the code.

```
System.Reflection.MethodInfo? (Alt+Enter)  
MethodInfo myMethodInfo;
```

Refactoring

Refactoring significantly improves your code design and efficiency. ReSharper's 17 automated refactorings take care of code consistency and compilability after even the most dramatic modifications.

ReSharper

System requirements

Processor:

Minimum: Pentium III 850 Mhz

Recommended: Pentium IV 1.5 Ghz

Memory:

Minimum: 256 Mb

Recommended: 512 Mb

Disk space: 100 Mb

Operating System:

Microsoft Windows 2000/XP

Software installed:

Microsoft Visual Studio 2003

Microsoft .NET 1.1

FEATURES

Syntax and Error Highlighting

- Error highlighting – automatically analyses code, highlights syntax or errors, can detect and warn about potential problems.
- Warnings – make user aware of redundant using directives; declared but never used local variables; declared but never used private fields; unused private methods; unused parameters in private methods; redundant type casts; unreachable code; documentation errors
- Marker bar emphasizes errors where they occur in the code, navigates directly to the marked code if user clicks on marker
- Navigate easily between errors and warnings in code
- Visual indicators in margin show where current method hides, overrides, or implements the corresponding method of a base class/interface
- Enhanced syntax-highlighting complements default Visual Studio highlighting with support for highlighting fields, local variables, types, and more.

Refactoring Support

- Rename symbols with reference correction – automatically find and correct all references to renamed namespace, type, method or field
- Move types easily between namespaces with automatically updated references
- Use “Change method signature” to modify signature of a method (add, remove, rename or reorder parameters, or to change return types or parameter types), with automatic reference correction
- Many more – JetBrains is unsurpassed for its refactoring support, whether you work in C# or in Java.

Enhanced Navigation

- Save time moving within the code
- Quickly navigate to type or file by typing its name
- Select a file from the list of most recent 30 files
- Navigate easily to a declaration of a symbol under the caret
- Move easily to declarations of base classes or overridden/implemented methods
- Move just as easily down the hierarchy, selecting branches to correct derived class or overriding method
- Easily view the structure of the current file and navigate instantly to any member

Many Additional Features

ReSharper 1.5 offers a host of additional developer productivity-enhancing features, from code generation and completion to coding assistance and automatic formatting. Live templates enable customized shortcuts to often-used snippets of code, while “quick fix” boxes allow the user to instantly tighten code or correct possible problems by selecting from a list of alternative suggestions. All such features can be selected or suppressed to fit the developer’s personal style. ReSharper only helps – it never intrudes.
