

Adding a GWT Facet to a Module

When you add a [dedicated GWT facet](#) to a module, IntelliJ IDEA re-configures the module and adds all the necessary libraries automatically.

To add a GWT facet to an existing module

1. [Open the Project tool window](#) (e.g. **View | Tool Windows | Project**).
2. Right-click the module and select **Add Framework Support**.
3. In the left-hand pane of the **Add Frameworks Support** dialog, select the **Google Web Toolkit** check box.
4. In the **GWT SDK** field, specify the GWT SDK location. (To download the latest version of the GWT SDK, use the **Download GWT** link.)
5. If you want a [sample GWT application](#) to be created, select the **Create sample application** check box and specify the application name in the field underneath.
6. Click **OK** in the **Add Frameworks Support** dialog.
