

Adding and Removing Facets

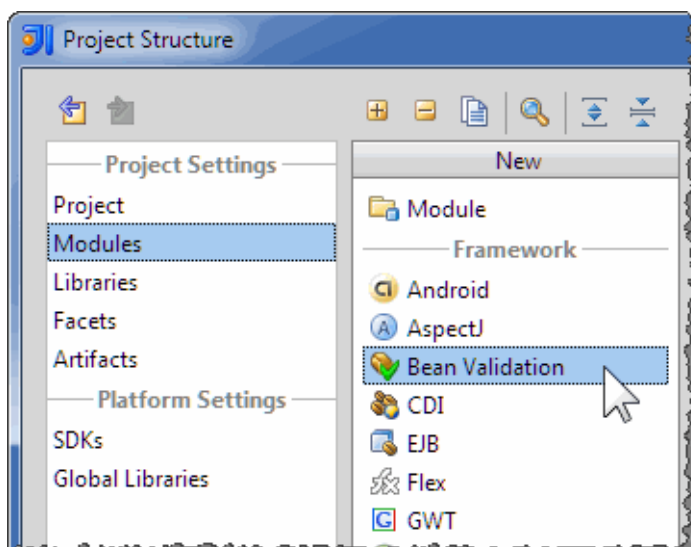

You can add [facets](#) to [modules](#) as well as remove them.

When adding facets to a module, take into consideration the [facet dependencies](#), and also the possibility to add multiple instances of the same facet.

- [Adding a facet to a module](#)
- [Removing a facet from a module](#)

To add a facet to a module

1. [Open the Project Structure dialog](#) (Ctrl+Shift+Alt+S).
2. Under **Project Settings**, select **Modules**.
3. Select the module you want to add a facet to, click **+**, and select the facet you want to add.

Note that certain facets have other facets as their parents. To add such facets, you should select a parent facet (rather than the module) prior to clicking **+**.

For example, a parent facet for a JSF or a Struts facet is a Web facet. So a JSF or Struts facet can be added only if a Web facet is currently selected. For more information, see [Available Facets and Their Dependencies](#).

4. [Configure the facet settings](#), and click **OK** in the **Project Structure** dialog.

To remove a facet from a module

1. [Open the Project Structure dialog](#) (Ctrl+Shift+Alt+S).
2. Under **Project Settings**, select **Modules**.
3. Expand the module node and select the facet to be removed.
4. Click **-**.
5. Click **OK** in the **Project Structure** dialog.

Note that no files are physically deleted as a result.
