

# Analyzing Inspection Results

After you [perform code analysis](#) or [execute a single inspection](#), you can examine the results in the [Inspection tool window](#).

Each run of the code analysis or a single inspection is displayed in a new tab in the tool window. The left part of the tab displays detected code issues grouped by inspection groups, inspections and files. If necessary, you can change the default grouping. When you select a specific issue, its report appears in the right part.

In the **Inspection** tool window you can:

- [Resolve issues using quick-fixes](#) where available.
- [Jump to the source of the problem](#) to resolve it manually.
- [Export inspection results](#) to an XML or HTML file.
- [Disable inspections](#) to skip all corresponding issues next time you ran code analysis.
- [Suppress inspections](#) for specific code issues.
- [Access inspection settings](#) to configure inspections.
