

Attaching the Debugger to a Running Process

Besides debugging an Android application by [initiating a debugging session](#), you can apply the debugger to an already running application.

To debug a running android application

1. On the toolbar, click the **Attach debugger to Android process** button .
2. In the **Choose Process** dialog box that opens, select the relevant process from the list. The dialog box shows all the currently active processes grouped by devices they are running on.
