

## Binding the Form and Components to Code

---

If you have not created a [bound class](#) by default, when creating a new form, you do it explicitly, as described below.

There are two basic ways you can approach explicit binding depending on your situation:

- Bind a form to an [existing class](#), and its components to the fields of this class.
- Bind a form and its components to a [class and fields that don't yet exist](#).
