

Choosing a Method to Step Into

When you reach a line with calls of several methods, you can choose the method you want to step into.

If you choose a method of a class stepping into which is suppressed on the [Debugger Stepping](#) page of the [Settings](#) dialog box, the suppression is overridden as when you invoke the *Force Step Into* command.

To choose a method to step into

1. On the main menu, choose **Run | Smart Step Into** or press **Shift+F7**.
2. In the pop-up window, choose the desired method from the list.
