

Configuring Check/Assert Methods

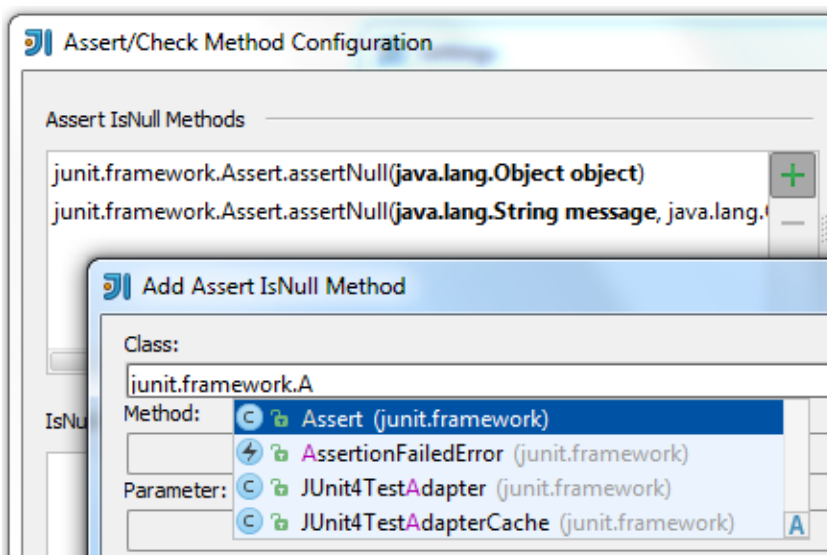

Using the configurable 'assert' or 'check' calls helps avoiding warnings on the good code.

Configuring IsNull/IsNotNull conditions

1. Expand the **Probable bugs** node of the **Inspections** page, and in the inspection *Constant conditions and exceptions* click **Configure Assert/Check Methods** button:

2. In the **Assert/Check Method Configuration** dialog box, fill in configuration elements, using **+** button. Specify the classes and methods which perform the check and the method parameter that is the subject of the check.

3. Apply changes and close the **Settings** dialog.
4. **Inspect** source code.
