

# Configuring Device Layout

---

IntelliJ IDEA provides facilities for [configuring layout](#) of actual and virtual of devices to run Android applications on. Device layouts are defined in the `res/layout/*.xml` files. When editing a layout definition file, the following coding assistance is provided:

- Code completion for paths, tags, and boolean variables.
- References to other resources of the types `@string`, `@color`, and `@drawable`.

## To have full coding assistance at disposal

1. Open the relevant layout definition file in the editor.
2. In the `<LinearLayout>` root element, specify the `http://schemas.android.com/apk/res/android` schema as the value of the `xmlns:android` field.
