

Configuring Gradle Integration

In order to successfully import and run a Gradle project, you have to specify Gradle location. This can be done in one of the possible ways:

- Outside of IntelliJ IDEA, by setting the environment variables `GRADLE_HOME` or `PATH`.
- In the **Gradle** page of the **Settings** dialog. This location can be defined both for the current project, and for the template project.

To define Gradle location in the Settings dialog

1. Open [current project](#) settings or [template project](#) settings.
2. Open the [Gradle page](#). If the environment variables `GRADLE_HOME` or `PATH` have been defined in advance, IntelliJ IDEA deduces Gradle location from these environment variables, and suggests the deduced path by default.

You can accept the default value, or specify a different Gradle location. In this case, the entered path will override the values of the environment variables.
