

Configuring Mobile Java SDK

Before you start developing your mobile application with IntelliJ IDEA, you should download either Wireless Toolkit 1.x/2.x or other, or DoJa SDK. This section describes how to configure such mobile SDK in IntelliJ IDEA, although you can configure it while creating a project.

To configure mobile SDK

1. [Open the Project Structure dialog](#) (Ctrl+Alt+Shift+S).
2. Go to **SDKs** section and click the plus button to add a new SDK. Select **Mobile SDK** from the drop-down list.
3. In the [dialog that opens](#), specify the SDK installation folder (WTK or DoJa). The new SDK is added to the list.
4. If necessary, configure the preverify options.
5. Click **OK** to save changes and close the **Project Structure** dialog.
