

## Configuring Primary Key

---

*Primary keys* are defined for *CMP Entity beans* and *BMP Entity beans*, versions 1.x and 2.x.

Same as the other bean properties, the primary keys can be defined by editing the source code, or using the tools provided by IntelliJ IDEA.

### To configure a primary key

1. [Create a new entity bean](#).

Alternatively, [open the desired bean for editing](#), and click the **Change EJB Classes** button.

2. In the **Primary key class** field specify the class that will be used to access the primary key of a datasource the bean is associated with.
3. From the **CMP version** list select EJB specification version for the bean. This setting is disabled for BMP entity beans.
