

Configuring Project Settings

Project settings refer to a set of preferences related to resources, file colors, version control options, code styles, etc. Project settings are stored with each specific project as a set of `xml` files under the `.idea` folder.

You can configure project settings on the two possible levels:

- The level of a *template project*. The settings defined for a template project, apply to any project you create.
- The *project level*. The settings defined on this level apply to the current project only.
