

Configuring Triggers for Ant Build Target

You can configure triggers that run Ant targets before or after certain events, for example, compiling, running, or testing. These triggers are called *compilation trigger* and *execution trigger* respectively.

To set up a compilation trigger

1. On the [Ant Build Tool Window](#), right-click the desired build target.
2. On the context menu of the target, choose **Execute on**.
3. On the submenu, choose **Before Compilation** or **After Compilation**, as required. Note that you can set up both options.

To set up an execution trigger

1. On the Ant Build tool window, right-click the desired build target.
2. On the context menu of the target, choose **Execute on**.
3. On the submenu, choose **Before Run/Debug**. Execute Target Before Run/Debug dialog appears, presenting the list of possible execution types.
4. In the dialog, select check boxes next to the types of execution that should trigger the selected Ant target, and click **OK**.
