

Configuring Triggers for Maven Goals

You can configure triggers that execute Maven goals before or after certain events, for example, compiling, running, or testing. These triggers are called *compilation triggers* and *execution triggers* respectively.

To set up a trigger

1. On the [Maven Projects tool window](#), right-click the desired node (a phase of the lifecycle, or a plugin).
2. On the context menu, click one of the options:
 - **Execute before Make**
 - **Execute after Make**
 - **Execute before Run/Debug**
