

Create HTML Wrapper Template Dialog

Use this dialog to configure and create an [HTML wrapper](#) template for your Web-targeted ActionScript or Flex application.

The generated template (`index.template.html`) will contain a set of tokens, such as `${title}`, `${swf}`, etc. During the compilation, these tokens will be replaced with the appropriate values. For example, `${swf}` will be replaced with the `.swf` file name. The resulting `.html` wrapper file will have the same name as the `.swf` file.

See also, [Using the SWF metadata tag to control HTML wrapper properties](#).

Item	Description
Create HTML wrapper template in the following folder	Specify the folder in which the HTML wrapper template files should be created. Use  (Shift+Enter) to select the folder in the corresponding dialog .
Enable integration with browser navigation	Select this option to enable deep linking. Deep linking lets users navigate their interactions with the application by using the Back and Forward buttons in their browser.
Check Flash player version	If you select this option, the compiled application will check for the correct version of Flash Player.
Express install	If you select this option, the application will run an SWF file in the existing Flash Player to upgrade users to the latest version of the player.
