

Creating a Library for aspectjrt.jar

To be able to use the AspectJ support, in addition to [enabling AspectJ support plugins](#), you should create a [library](#) containing aspectjrt.jar and add this library to dependencies of the [modules](#) in which you are going to develop your aspects.

aspectjrt.jar is included in AspectJ Development Kit (AJDK) which you can download from the [AspectJ website](#).

To create a library for aspectjrt.jar and add it to module dependencies

By the time you start to perform this task, the AJDK must have already been downloaded and installed.

1. [Open the Project Structure dialog](#).
2. Depending on whether you want to create the new library at the project or the IDE level, select **Libraries** or **Global Libraries**.
3. Click **+** (Alt+Insert) and select **Java**.
4. In the [dialog that opens](#), find and select aspectjrt.jar. (This file is located in <AJDK installation directory>\lib.)
5. In the **Choose Modules** dialog, select the modules you want to add this library to as a dependency and click **OK**.
6. Click **OK** in the **Project Structure** dialog.
