

Creating a List of Phing Build Files

A correct Phing build file is an `xml` file with the root element `<project>`. Build files are created outside the [Phing Build](#) tool window and are normally stored under your PHP project root folder.. Find more about writing Phing build files in [Phing Getting Started](#) .

In this section:

- [Accessing the Phing Build tool window](#)
- [Managing lists of build files](#)

To open the Phing Build tool window, do one of the following

- If the Phing support is not [enabled in the project](#), open a Phing build file in the editor or select it in the [Project](#) tool window, and then choose **Add as Phing build file** on the context menu of the selection.
- If Phing is supported at the project level, choose **View | Tool Windows | Phing Build** on the main menu.

To configure a list of build files, perform these general steps

- [Open the Phing Build](#) tool window.
- To add a build file to the list, click the **Add** button  on the toolbar and choose the required `.xml` build file in the **Select Phing Build File** dialog box, that opens.
- To remove a build file from the list, select the file and click the **Remove** button  on the toolbar.
- To navigate to the source code of a build file, select the desired file and choose **Jump to Source** on the context menu of the selection.
