

Creating a Remote Service

Developing a GWT service requires creating synchronous and asynchronous interfaces as well as server implementation with the correct names and structure. Also they should be registered in the `xm1` module descriptor. IntelliJ IDEA can generate all the required parts automatically.

To generate a remote service

1. In the **Project view**, right-click the **client** package.
2. From the context menu, select **New | Google Web Toolkit | GWT Remote service**.
3. Specify the name for the service and click **OK**.
