

Creating an Entry Point

A GWT module entry point is any class that can be assigned to `EntryPoint` and can be constructed without parameters. When a module is loaded, every entry point class is instantiated and its `EntryPoint.onModuleLoad()` method is called.

To generate an entry point

1. In the **Project view**, right-click the **client** package.
2. From the context menu, select **New | Google Web Toolkit | GWT Entry point**.
3. Specify the name of the entry point and click **OK**.
