

Creating and Disposing of a Form's Runtime Frame

To make your form work, you have to provide a runtime frame for it. The `main()` method for GUI forms takes care of creation and disposal of such frame.

To create a `main()` method for a form

1. Open for editing the bound class of a form where you want to create the `main()` method.
2. Press `Alt+Insert`.
3. On the pop-up menu, click **Form main()**. The following method is added to the source code:

```
public static void main(String[] args) {  
    JFrame frame = new JFrame("<class name>");  
    frame.setContentPane(new <class name>().contentPane);  
    frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);  
    frame.pack();  
    frame.setVisible(true);  
}
```
