

## Creating and Editing Relationships Between Domain Classes

Use the **Domain classes dependencies** diagram for creating and editing relationships between the domain classes.

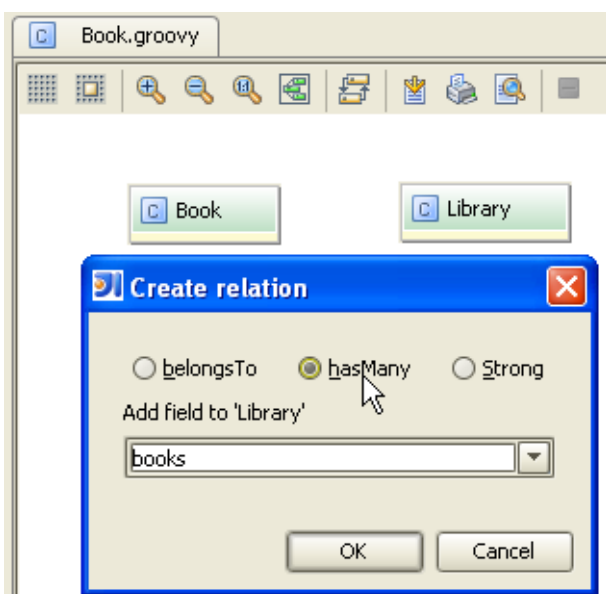

The **diagram** is completely synchronized with the source code: the changes in the source code are immediately reflected in the diagram, and vice versa, adding or deleting a link in diagram introduces relevant changes to the source code.

### To create relationship between domain classes

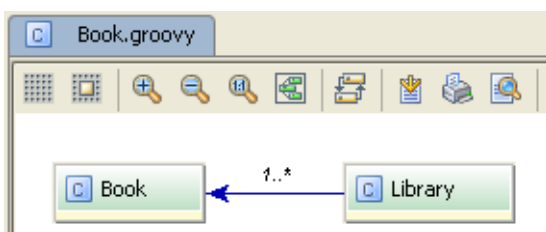

1. Select the desired domain class, and click the **Domain classes dependencies** tab that is located on the bottom of the editor.
2. Click the source domain class and draw a link to the target domain class:

3. In the dialog box that opens, specify the type of relationship, and the name of the field to be created:

The resulting relationship is displayed in diagram:
