

Creating .Feature Files

Once *Cucumber* support is [enabled](#), you can create feature files under the test sources.

To create a feature file

1. In the Project tool window, right-click a directory, where feature files should be created.
2. On the context menu of the target directory, choose **New | File**, and in the **New File** dialog box, type `<name>.feature`.
3. In the feature file, type your scenario. Since there are no step definitions, the steps will be highlighted as unresolved.
4. [Create step definitions](#).
