

Creating Groovy Scripts

To create a Groovy script, do one of the following

- Choose **New | Groovy script** on the context menu of the destination package. In this case, IntelliJ IDEA creates a file with the specified name and `groovy` extension, and adds a node to the module tree view.
- A Groovy class that contains anything but declarations, is perceived as a script. Thus, if you open a Groovy class in the editor, and type the desired source code, the corresponding file is automatically converted into a Groovy script, and is marked with the script icon:
