

Data Binding Wizard

Use this dialog box to generate *getData* and *setData* methods for the fields in a UI class that are bound to components in a GUI form.

Item	Description
Page 1	
Create new bean	Click this radio button to bind components to data in a new bean class. If this option is selected, specify the name of the new bean class, and the package where it will be created.
Bind to existing bean	Click this radio button to bind components to data in an existing bean class. If this option is selected, specify the name of the desired bean class.
Page 2	
Form Field	This column displays the list of components of the GUI Form that can be bound to data.
Bean Property	Use this column to specify the name of the bean property that will be created in the specified bean class.
getData()	If this option is checked, the method <code>getData()</code> is generated in the bound class of the GUI form.
setData()	If this option is checked, the method <code>setData()</code> is generated in the bound class of the GUI form.
isModified()	If this option is checked, the method <code>isModified()</code> is generated in the bound class of the GUI form.
