

DBGp Proxy

File | Settings | PHP | Debug

The page and all the pages under this node are available only when the [PHP repository plugin](#) is [downloaded](#), [installed](#), and [enabled](#).

On this page, enable, disable, and re-configure your access to debugging PHP applications in the multiuser mode via an [Xdebug proxy server](#).

Item	Description
IDE key	In this text box, specify the name for the Proxy server to identify connections from your IDE. This should be the value of the <code>xdebug.idekey</code> setting in your currently active <code>php.ini</code> configuration file.
Host	In this text box, specify the host on which the Xdebug proxy server resides.
Port	In this text box, specify the port which IntelliJ IDEA will listen to during a proxy debugging session.
