

Defining Scope-Profile Combination

A project can be divided into several areas of inspections, or [scopes](#), where different inspections should apply. You can associate any inspection with the needed scope.

By default, if an inspection is not associated with a scope, it applies to all the sources of the current project.

To define scopes for an inspection

1. [Open the Inspections dialog box](#).
2. Select the desired profile from the drop-down list. The inspections associated with the profile are displayed in the tree view.
3. Select the desired inspection and click the **Add** button **+** on the toolbar.
4. In the **Choose Scope** dialog box that opens select the area to apply the inspection to.

You can configure custom scopes in the [Scopes](#) dialog box, in addition to default ones, like production, tests, etc.

5. Apply the changes and close the dialog box.
