

Defining the Set of Changelists to Display

With the extended [Merge Info](#) functionality, you can restrict the set of changelists displayed in the [Changelists](#) pane to the changelists that have been integrated from one specific branch to another. These branches are referred to as "source" and "target" respectively.

To specify the branches involved

1. Open the **Changes** tool window and switch to the **Repository** tab.
2. To have the [Merge Info](#) pane displayed, click the **Highlight Integrated** button  on the toolbar.
3. In the **From** text box, specify the URL address of the source branch.
4. In the **To** text box, specify the path to the target branch.

If necessary, use the **Browse** button  to open the [Select Branch](#) dialog box.

5. Specify the path to the local [working copy](#) to which you will apply patches created based on selected changelists.

If necessary, use the **Browse** button  to open the **Configure Working Copy Paths** dialog box.
