

Documentation

Documentation for xslt-elements and predefined XPath-functions

The plugin comes with bundled documentation for XSLT elements and functions that is accessible via the **Quick Documentation Lookup (Ctrl-Q)** action. This documentation is extracted from the respective sections in the official W3C XSLT and XPath documents.

```
<xsl:value-of select="count(//node)" />
```

The screenshot shows a documentation popup window with a light yellow background and a grey header containing three navigation icons (back, forward, and search). The main content area contains the following text:

Function: *number* **count**(*node-set*)

The **count** function returns the number of nodes in the argument node-set.

Custom documentation

It's also possible to annotate elements in an XSLT stylesheet with some documentation fragments. This can be looked up by the Quick Documentation Lookup function for variables, parameters and templates

```
<!-- This is some comment about this template -->  
<xsl:template name="test">
```

```
</xsl:template>
```

```
<xsl:template match="/">  
  <xsl:call-template name="test" />  
</xsl:template>
```
