

Drag-and-Drop

In order to increase development speed and prevent errors the plugin allows you to use drag&drop operations to generate simple code but that would otherwise be more error prone and take time from the task at hand.

This section covers the following features:

- [Drag&Drop Components](#)
- [Drag&Drop Pages](#)
- [Drag&Drop Mixins](#)

Drag&drop components

Drop in Page or Component Template

This drop operation will result in a reference to the dropped component being inserted at the drop point with all required attributes set.

Drop in Page or Component Class

This drop operation will result in the declaration of an embedded component in the target class.

```
@Component
private ActionLink _actionLink;
```

Drag&drop pages

Drop in Page or Component Template

This drop operation will result in a page link to the dropped page being inserted at the drop point.

```
<t:pagelink page="Home">Link to Home</t:pagelink>
```

Drop in Page, Component or Mixin Class

This drop operation will result in the injection of the dropped page in the target class.

```
@InjectPage
private Home _home;
```

Drag&drop mixins

Drop in Component Class

This drop operation will result in the declaration of the usage of an implementation mixin.

```
@Mixin
private MyMixin _myMixin;
```

You will only be able to use the drag&drop feature if a valid drop target is in the currently open editor.
