

Editing Module with EJB Facet

Though you can directly edit the source code of the deployment descriptor of a module with EJB facet, it is also possible to use a dedicated [editor](#), where you can manage the contained beans, their relationships and security permissions.

You can only edit the modules that contain `ejb-jar.xml` descriptor. For annotations-only modules, edit the annotations manually to adjust the module settings. If both annotations and `ejb-jar.xml` descriptor are present in a module, the descriptor settings override annotations.

To edit a module with ejb facet

1. Open the [EJB tool window](#).
2. Right-click the desired module, and do one of the following:
 - Choose **Jump to Source** on the context menu.
 - Press F4.
 - Double-click the EJB module node.

Same way you can also open for editing the `ejb-jar.xml` file. In this case, in addition to the **General**, **Method Permissions**, and **Transaction Attributes** tabs, the editor provides the **Text** tab, with the EJB-aware XML editor.

3. On the [General tab](#) of the editor, [add new beans](#), [edit existing beans](#), or delete them.
4. On the [Method Permissions tab](#), configure security roles.
5. On the [Transaction Attributes tab](#), specify transaction attributes for the bean methods.
