

## EJB Relationship Properties dialog

---

The **EJB Relationship Properties** dialog opens when you draw a line between entity beans on an **EJB ER diagram**. (In this way you create a relationship between the corresponding beans.)

Use this dialog to define the relationship properties, and also to add the corresponding elements to the deployment descriptor.

Item	Description
Relationship Name	Type the name of a new relationship link.
Description	Type optional description. If the text is long, click the ellipsis button, and type the desired text in the editor dialog box.
Role 1,2	Use these sections of the dialog box to specify attributes of each side of a relationship link.
EJB	Select the source and target EJBs from the drop-down lists.
Role name	Type the names of the roles for each side of the relationship link.
Multiplicity	Select multiplicity from the drop-down list.
CMR Field	Select this check box, if you want to create a container-managed relation field <code>&lt;cmr-field &gt;</code> in the deployment descriptor. If this option is checked, specify following attributes.
Field name	Type the name of the new CMR field. The <code>&lt;cmr-field-name&gt;</code> element is generated in the deployment descriptor.
Field type	Select the type of the new CMR field. The <code>&lt;cmr-field-type&gt;</code> element is generated in the deployment descriptor.
Getter / Setter	If the check boxes are selected, the getter and setter methods are generated in the bean implementation class.
