

Enabling Struts 2 Support

Enabling the [Struts 2 framework support](#) for developing Web applications in IntelliJ IDEA involves:

- [Configuring the module, downloading and adding the required libraries.](#) Use the dedicated Web and Struts 2 [facets](#) to have it done automatically.
- [Defining the list of files to validate.](#)

To configure a struts 2 module and download the required libraries, do one of the following:

- [Create a new module](#) with the dedicated Web and Struts 2 facets. IntelliJ IDEA will download and add the necessary libraries and configure the project automatically.
- [Add the dedicated facets](#) to an existing module.

A Struts 2 facet can be created only as a child of a Web facet. Make sure a Web facet is already attached to the module.
