

Enabling Tapestry Support

The *Tapestry* technology in a module is supported through a dedicated [Tapestry facet](#).

Only one Tapestry facet per module is allowed.

In this section:

- [Creating a Tapestry module](#)
- [Enabling Tapestry support in an existing module](#)

To enable Tapestry support in a new module

1. [Create a new Java module from scratch](#).

On the first page of the wizard, select **Java Module**, not **Web Module**. (The Web module type is for developing web applications using programming languages other than Java, for example, [PHP](#), or [JavaScript](#), or [markup languages](#).)

2. On the **Technologies** page of the wizard, select the **Tapestry** check box.
3. In the **Tapestry Settings** area, specify the Tapestry libraries to use or download.

To enable Tapestry support in an existing module

1. [Open the Module Settings dialog box](#).
2. With the desired Java module selected, click **+** on the toolbar, and select **Tapestry** from the list of facets available for this module.
3. Click the **Tapestry** facet node. In the **Facet 'Tapestry'** dialog box, specify the [application configuration settings](#):
 - **Application filter** is the filter that will be configured in your `web.xml`
 - **Application package** is the [application root](#) package.
