

Error Detection

There are several errors that are only found when the application is running. With Loomy it's possible to detect many of these errors without losing the time to run the application.

The plugin can detect the following errors:

Invalid component references

```
[<a t:type="pageLink2" t:page="Home" href="">refresh</a>]
```

Invalid component name

Missing required parameters

```
[<a t:type="pageLink" href="">refresh</a>]
```

Missing required parameter "page"

Invalid page names

```
[<a t:type="pageLink" t:page="Home2" href="">refresh</a>]
```

Invalid page name

Invalid property

```
[<a t:type="TextField" t:value="Property1" translate=""></a>]
```

Invalid property
