

Extract Delegate Dialog

Refactor | Extract Delegate

Use this refactoring to extract class members into a new class.

Item	Description
Extract class from	This read-only field shows the fully-qualified name of the selected class.
Name for new class	Type the name of the new class to which selected members will be extracted.
Package name	Specify the name of the destination package where the new class will be created. By default, current package name is displayed. You can type a different package name in the text field, or click the ellipsis button and select the destination package. If the desired package doesn't exist, click  to create a new one.
Members to extract	This section contains a list of members of the selected class. To include a member into the new class, select the check box to its left.
