

Extract Method Object Dialog

Refactor | Extract Method Object

Use this refactoring to extract method object, when **Extract Method** refactoring is not applicable, because of multiple return values.

Item	Description
Create inner class	Select this option, if you want to extract method object to an inner class. All the local variables will become fields on that class. Specify also name for the class and visibility scope. You can make the class static, if needed.
Create anonymous class	Select this option to an object with the corresponding method.
Parameters	In this area select the variables that will be used as a parameters. Use Move Up/Move Down buttons to reorder parameters/
