

File Cache Conflict

An external process has changed a file, opened and unsaved in IntelliJ IDEA, which results in two conflicting versions of a file. Resolve this conflict using the following options.

Item	Description
Load FS Changes	Click this button to load the file version produced outside of IntelliJ IDEA, and overwrite your local changes.
Keep Memory Changes	Click this button to preserve the version produced in IntelliJ IDEA and stored in cache.
Show Difference	Click this button to invoke the differences viewer that shows the version in the file system to the left, and IntelliJ IDEA version to the right. You can merge differences as required and load the desired version to IntelliJ IDEA. By default, the cache version is saved.
