

# Grouping Modules

---

If there are too many modules in your project, you may want to arrange them in module groups.

The module groups can be nested, that is, a group can contain subgroups, the subgroups - lower-level subgroups, etc.

## To organize modules in groups

1. In the [Project tool window](#) or in the [Project Structure dialog](#), right-click the desired module.
2. In the context menu, choose **Move Module to Group**.
3. In the submenu, choose one of the following:
  - **Outside any group:** If the selected module is currently a member of a module group, the module will be removed from the group. Otherwise, nothing will happen.
  - **New top-level group:** A new (top-level) module group will be created, and the selected module will become its member.
  - **To this group:** The selected module will be moved to the selected module group.
  - **To new sub group:** A new subgroup will be created in the selected group, and the selected module will be moved to this subgroup.
