

Hippie Completion. Expanding Words

This helpful feature analyses your text in the visible scope and suggests to complete a word with a keyword, class name, method or variable. So doing, the *prototype* is highlighted in the source code.

To expand a string at caret to an existing word

1. Type the initial string.
2. Press Alt+Slash. The editor shows the first suggested value.
3. Press Enter to accept the suggested word, or continue pressing Alt+Slash until the desired word is found.

Example:

```
reportArray(((PatternSet) robj).getExcludePatterns(getProject()));
System.out.println();
System.out.println("Include patterns: ");
reportArray(((PatternSet) robj).getIncludePatterns(getProject()));
getExcludePatterns|

reportArray(((PatternSet) robj).getExcludePatterns(getProject()));
System.out.println();
System.out.println("Include patterns: ");
reportArray(((PatternSet) robj).getIncludePatterns(getProject()));
getIncludePatterns|
```
