

Ignoring Hard-Coded String Literals

Sometimes you might want to ignore the hard-coded literals. To do that, use *Not requiring internationalization* annotation.

To ignore a certain hard-coded literal

1. Press Alt+Enter to show intention actions for the string literal:

2. Select **Annotate as @NonNls** from the suggestion list.
3. In the Select Path dialog that opens, specify the location where annotations.xml file will be stored.

Alternatively, you can add @NonNls annotation:

If you have selected the check box **Do not show this dialog in the future**, you can still choose annotation style in the Settings dialog ([Code Style | Java - Code Generation](#)).
