

## Integrating Perforce Files

You can merge changes between the branches into your local working copy, using the branch specification, or a changelist.

**Integrate Project** command is available for both Perforce and Subversion integrations.

Integration results display in the **Integrate Info** tab of the Version Control tool window. Context menu of a file enables you to compare versions, view history and annotations, browse changes and more.

### To integrate a Perforce branch into a project

1. On the main menu, choose **VCS | Integrate Project**.
2. In the Integrate dialog box, select the **Perforce** tab (if both Perforce and Subversion integrations are used in this project).
3. Select the sources to be merged, and the desired revision.
4. Define VCS-specific merge options.
5. Click **OK**.
