

JavaScript-Specific Guidelines

IntelliJ IDEA enables creating rich Internet applications and Web applications by providing elaborate support of [JavaScript](#) and tight integration with [AJAX](#) and other adjacent frameworks and technologies.

In this section:

- [JavaScript-Specific Guidelines](#)
 - [Prerequisites](#)
 - [JavaScript support](#)
 - [Developing an application that contains JavaScript](#)
- [Configuring JavaScript Libraries](#)
- [Creating JSDoc Comments](#)
- [Viewing JavaScript Reference](#)
- [JavaScript-Specific Refactorings](#)
- [Configuring JavaScript Debugger](#)
- [Debugging JavaScript](#)
- [Unit Testing JavaScript](#)
- [Using JavaScript Code Quality Tools](#)
- [Minifying JavaScript](#)
- [Using AngularJS](#)
- [Tracing with Spy-Js](#)
- [Using Bower Package Manager](#)

Prerequisites

Before you start working with JavaScript, make sure that **JavaScript Support** plugin is enabled.

The plugin is bundled with IntelliJ IDEA and activated by default. If not, enable the plugin as described in [Enabling and Disabling Plugins](#).

JavaScript support

JavaScript files are marked with  icon.

JavaScript support in IntelliJ IDEA includes:

- [Switching between JavaScript language versions to choose the one that suits the targeted browser:](#)
 - [JavaScript 1.5](#)
 - [JavaScript 1.6](#)
 - [JavaScript 1.7](#)
 - [JavaScript 1.8](#)
 - [JavaScript 1.8.5](#)
 - [ECMAScript 5.1](#)
 - [ECMAScript Harmony](#)

- Full coding assistance:
 - Smart, DOM-based, browser-type aware JavaScript [code completion](#) for:
 - Keywords, labels, variables, parameters and functions.
 - User defined and built-in JavaScript functions.
 - JavaScript namespaces.
 - Error and syntax highlighting.
 - Code [formatting](#) and [folding](#).
 - Numerous code [inspections](#) and [quick-fixes](#), including the **Switch to JavaScript <version>** quick-fix.
 - Support of the [strict mode](#)  standard.
 - Support for [ECMAScript](#) .
 - Initial support of [ECMAScript Harmony](#) .

- **Code Generation**

- Generating code stubs based on [file templates](#) during file creation.
- Inserting, expanding, and generating JavaScript code blocks using [live templates](#).
- Creating various applications elements via JavaScript and AJAX [intention actions](#).
- Possibility to create [line and block comments](#) (Ctrl+Slash or Ctrl+NumPad //Ctrl+Shift+Slash or Ctrl+Shift+NumPad /).
- [Unwrapping and removing statements](#).
- Possibility to build and view [type](#), [method](#) and [call](#) hierarchies
- Refactoring

IntelliJ IDEA provides both common refactoring types available for all the supported languages and JavaScript-specific refactoring.

- **Common refactorings:**
 - [Rename](#) a file, function, variable, parameter, or label (both directly and via references).
 - [Move/Copy](#) a file.
 - [Safe Delete](#) a file.
 - [Extract](#) inlined script from HTML to a JS file.
 - [Extract](#) function.
 - [JavaScript-Specific Extract Parameter Refactoring](#)
- Numerous ways to [navigate](#) through the source code, among them:
 - [Navigating with Structure Views](#).
 - Show/Goto Implementation (Ctrl+Alt+B or Ctrl+Alt+Button1 Click) from overridden method / subclassed class.
- Advanced facilities for [searching through the source code](#).
- Support of the [JSDoc](#)  format and [generating documentation comments](#).
- [Viewing reference](#) information:
 - Definitions, inline documentation, parameter hints.
 - [JSDoc comments](#).
 - Lookup in [external JavaScript libraries](#).

- **Running and debugging.**
 - Launching applications directly from IntelliJ IDEA by opening the starting application HTML page in the [default IntelliJ IDEA browser](#).
 - A dedicated [debug](#) configuration for launching debugging sessions directly from IntelliJ IDEA.
 - A JavaScript-aware [debugger](#) that lets you execute applications step by step, evaluate expressions, examine related information and find runtime bugs.
 - Support for [JavaScript breakpoints](#).
- Tight integration with related frameworks and technologies: [AJAX](#), [jQuery](#), [YUI](#), [DoJo](#), [Prototype](#), [MooTools](#), [Qooxdoo](#), and [Bindows](#):
 - Code completion for every framework.
 - [DoJo](#) style type annotations to provide more accurate completion and parameter type information.
 - [Quick Documentation lookup](#) for DoJo style commands.
- Support for the [JSON](#) (JavaScript Object Notation) format:
 - A JSON file [type template](#) mapped to `json` file extension.
 - JSON code [formatting](#) and [folding](#).

To develop an application that contains JavaScript

Developing an application that contains JavaScript, generally, includes performing the following steps:

1. Make sure the JavaScript Support plugin is enabled. The plugin is bundled with IntelliJ IDEA and activated by default. If it is not, [enable the plugin](#).
2. [Create a project](#) to implement your application. On the first page of the [New Project wizard](#), select **Static Web**.
3. On the [JavaScript](#) page of the [Settings](#) dialog box, choose the JavaScript language version that suits the targeted browser.
4. [Download, install, and configure JavaScript frameworks and libraries](#).
5. [Populate the project](#). Use the following IntelliJ IDEA facilities, where applicable:
 - [Coding assistance](#).
 - [Code Generation](#).
 - Various types of [navigation](#) and [search](#) through the source code.
 - [Viewing reference](#) and [generating documentation comments](#).
 - [Look-up in external libraries](#).
6. Improve the quality and maintainability of your code using various types of [refactoring](#), both common and JavaScript-specific.
7. Run your application by [opening its starting HTML page in the IntelliJ IDEA default browser](#).
8. [Debug](#) your application.

The JavaScript debugging functionality is incorporated in IntelliJ IDEA, so just [configure the debugger](#), whereupon you can start the [debugging session](#) and [proceed as usual](#): set the breakpoints, step through them, stop and resume the program, and examine it when suspended.

Debugging for JavaScript applications is supported only in the [Firefox](#) and [Google Chrome](#) browsers.
