

# JSF Tool Window

View | Tool Windows | JSF

This window is available only for modules with a JSF facet.

The JSF tool window provides a categorized hierarchical view of your JSF resources.

The categories correspond to JSF element types (managed beans, converters, components, etc.). You can show or hide the categories using the toolbar buttons. You can also open the elements shown in the tool window in the editor.

- [Toolbar](#)
- [Opening elements in the editor](#)

## Toolbar

Use the toolbar buttons to show or hide the corresponding categories of JSF elements. All the buttons are toggles that enable or disable displaying a category.

Item	Tooltip	Description
	Show from libraries	Click this button to show or hide the external library elements referenced from the source code of your JSF elements.  Note that enabling this option does not add a separate category to the tree view. It just makes the view scope broader adding to it the libraries that the corresponding modules depend on. As a result, the external library elements are shown in the appropriate JSF categories.
	Show Managed Beans	Click this button to show or hide managed beans.
	Show Converters	Click this button to show or hide converters.
	Show Components	Click this button to show or hide (UI) components.
	Show Renderers	Click this button to show or hide renderers.
	Show Validators	Click this button to show or hide validators.

## Opening elements in the editor

You can open the elements shown in the **JSF** tool window in the editor. To do that, select the element of interest and press **F4**.

To open the elements which are the "leaves" of the tree (i. e. the ones at the bottom of the hierarchy), you can also use a double click.
