

Listeners

A listener receives notifications on any events related to the Web application, such as deployment/undeployment of the Web application, activation/deactivation of an HTTP session, as well as on adding, removing, and replacing attributes of the application/session.

Listeners, as a part of a Web application, are configured in the Web module deployment descriptor `web.xml`.

To define a listener element

1. [Configure a new listener](#).
2. Switch to the **Text** view and specify the necessary settings in the Web application deployment descriptor.
