

## Navigating Between an Observer and an Event

If a method is marked as an observer of a certain event type, you can jump to a method where this event is raised, using the [Show Usages](#) command.

### To navigate from an observer to an event to be observed

1. In the editor, place the caret at the event type value in the **@Observer** annotation.
2. Press **Ctrl+Alt+F7**, or choose **Edit | Find | Show Usages** on the main menu.
3. From the suggestion list, select the desired destination.

The class containing the method that raises the event in question, is opened in a separate tab, the caret resting at the event type value:

```
events.raiseTransactionSuccessEvent("bookingConfirmed");
```

If an event is defined in the `components.xml` file, same kind of navigation is also available for it.
