

Navigating to Underlying Code

Besides the basic way to [jump to source code](#), IntelliJ IDEA provides additional facilities.

To navigate to the source code of a hibernate element, do one of the following

- In the [Persistence tool window](#), select the desired element or attribute, and choose **Jump to Source** on its context menu, or just press F4. So doing, the corresponding descriptor file opens with the caret at the Hibernate class or attribute declaration.
- In the Hibernate ER diagram of a session factory, select the desired node, and choose **Edit Hibernate Class** on the context menu. So doing, the corresponding Java class opens with the caret at the class declaration.
