

Navigation

Basically all possibilities for code-navigation are supported for named templates, variables and parameters. For example: Goto Declaration, Find Usages, Highlight Usages in File, Quick Definition Lookup, etc.

```
<xsl:variable name="var" select="123" />
<xsl:value-of select="$var + $var" />
```

Find usages

Find Usages works for Variables and Parameters as well as named XSLT Templates. It finds all places of a certain template in all XSLT Stylesheets that are contained in the specified scope.

Goto symbol

The plugin also supports IntelliJ IDEA Goto Symbol action. The names of templates, top-level variables and parameters are offered for that action to be able to quickly navigate to them by their name.
