

Navigation

Loomy allows easy navigation between several elements in your template are the related content.

You can navigate:

- [Between a template and the corresponding class.](#)
- [From a tag to the corresponding component class.](#)
- [From a property value to the associated method.](#)
- [To the component documentation.](#)

Between template and class

Probably the most used navigation. Loomy provides an action (`Ctrl+Shift+G` by default) that allows you to navigate from a template to it's corresponding class and vice-versa.

From tag to component class

This navigation allows you to navigate from a component tag in your template to that component class. Just press `Ctrl+Click` on the tag itself.

From property value to associated method

If you have bound a component parameter with a property you can now just press `Ctrl+Click` on the parameter value in your template and you will navigate to the method that corresponds to the given property.

To component documentation

This navigation allows you to navigate from a component tag in your template to that component documentation displayed in the Tapestry ToolWindow. This action is associated by default to the key `Shift+Ctrl+D`, so just use when the cursor is on a component tag and you'll see it's documentation.
