

OSGi Bundles

The *OSGi Bundles* run configuration allows running bundles that don't have any dependencies on a specific OSGi framework implementation on any of the installed framework instances.

Currently there are limitations for this run configuration type:

- Only the core framework bundle will be loaded.
- Your bundles cannot depend on any other bundles of the framework.

To create an OSGi bundles run configuration, perform the following general steps

- [Open the Run/Debug Configurations](#) dialog box, click the **Add** button **+**, and choose **OSGi Bundles**.
- In the dialog box that opens choose a framework instance to run your bundles on and specify the bundle to start with.
